A Hadwiger like conjecture for oriented cliques

Sagnik Sen

July 12, 2018

An *oriented clique* or an *oclique* is an oriented graph in which any pair of non-adjacent vertices are connected by a directed 2-path.

The *oclique number* $ocn(\mathcal{F})$ of a family $\mathcal{F}$ of oriented graphs is the maximum number of vertices of an oclique contained in $\mathcal{F}$.

Let M_t be the family of K_t-minor free (oriented) graphs. Then we conjecture that

$$ocn(M_t) = 2^{t-1} - 1.$$
